Note: Signs of couplings from $\pi N \rightarrow N\pi\pi$ analyses were changed in the 1986 edition to agree with the baryon-first convention; the overall phase ambiguity is resolved by choosing a negative sign for the $\Delta(1620) S_{31}$ coupling to $\Delta(1232)\pi$.

 $\Delta(1905)$ FOOTNOTES

¹ From method II of LONGACRE 75: eyeball fits with Breit-Wigner circles to the T-matrix amplitudes.

² See HOEHLER 93 for a detailed discussion of the evidence for and the pole parameters of N and Δ resonances as determined from Argand diagrams of πN elastic partial-wave amplitudes and from plots of the speeds with which the amplitudes traverse the diagrams.

³ LONGACRE 78 values are from a search for poles in the unitarized T-matrix. The first (second) value uses, in addition to $\pi N \rightarrow N\pi\pi$ data, elastic amplitudes from a Saclay (CERN) partial-wave analysis.

⁴ The range given for DEANS 75 is from the four best solutions.

⁵ A Breit-Wigner fit to the HERNDON 75 IPWA.

⁶ A Breit-Wigner fit to the NOVOSELLER 78B IPWA.

⁷ A Breit-Wigner fit to the NOVOSELLER 78B IPWA; the phase is near 90°.
